

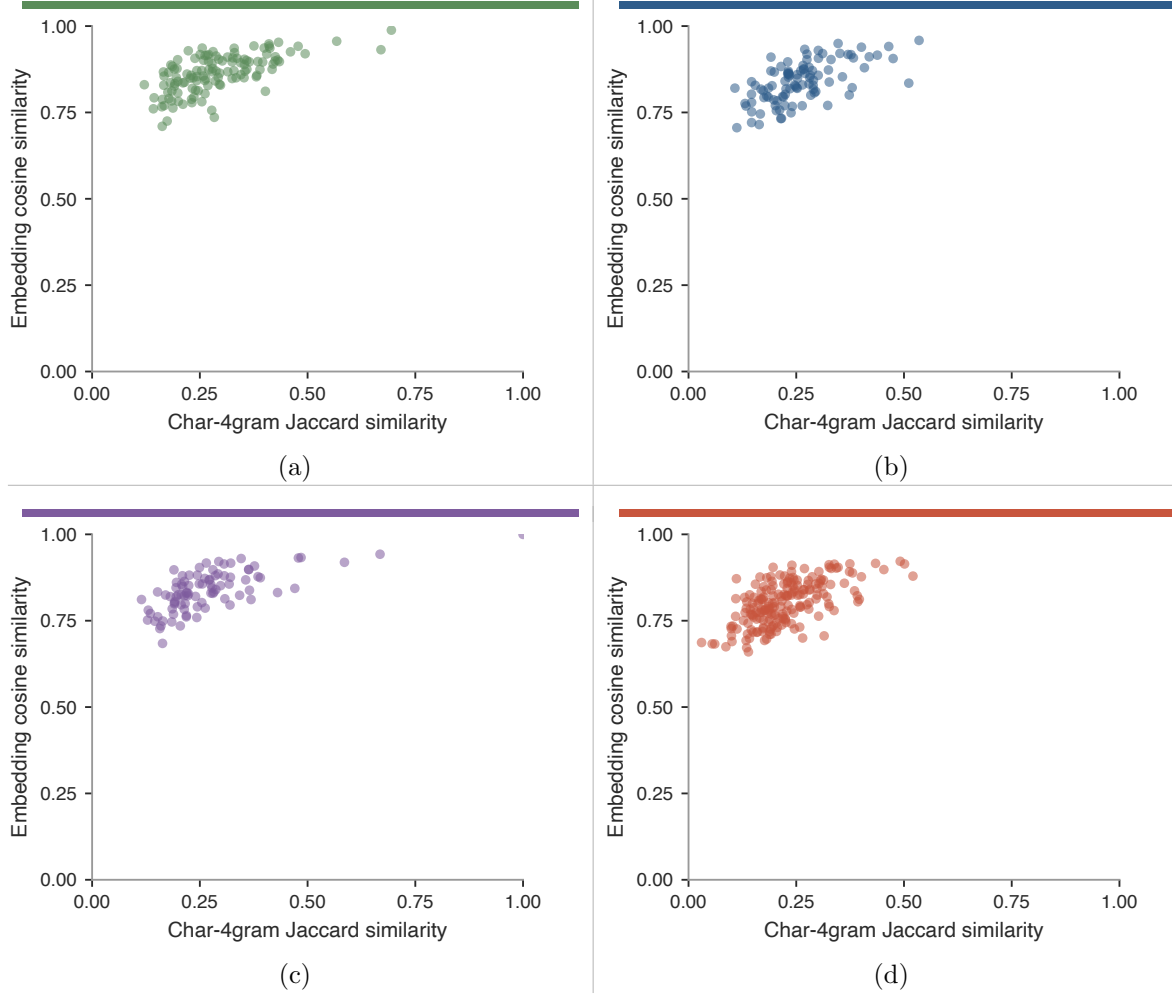

Figure 1: Embedding cosine vs. char-4gram Jaccard similarity for the 500-pair $f \rightarrow i$ rank-1 sample, split by direction-correctness bucket: ● both directions rank-1 correct ($n=121$, $\rho=0.65$); ● only $f \rightarrow i$ correct ($n=98$, $\rho=0.62$); ● only $i \rightarrow f$ correct ($n=90$, $\rho=0.67$); ● neither direction correct ($n=191$, $\rho=0.60$). Spearman ρ sits tightly around the overall 0.66 across all buckets; what shifts is the *location* of the cloud, not its slope.
